

Child's Eye Test

A child's eyesight develops from its birth and almost completes at the age of 6 years. But if there is strong ametropia (far sight, near sight and astigma) or cross-eye, the growth of the function of eyes may get delayed and good eyesight may not be developed. It's important to find such abnormality quickly and provide a proper medical treatment or instruction at the early stage. (We may find a visual disorder that is hard to find in the regular life).

An eye test is very important to find such abnormality. At the age of 3, a child is able to go through such eye test after some practice. Therefore, please fill out this questionnaire and read "Eye Test at Home" written on the back carefully before taking the eye test. Also, please describe the result and bring this paper on the day of Health Check-up for 3 years old child.

*This interview will not be used for any other purposes but to manage child-health
