

Hearing Test

People around take quick notice of such serious deafness of a child who almost doesn't react to any big sound or even loud voice of calling him.

But such slight to moderate deafness usually goes unnoticed while calling it as starting of "speak" seems slow or lurching and if you leave it lay, and it influences growth of word, mind and body severely.

Therefore, it is very important to check the hearing condition. For that purpose, please fill up the questionnaire and check child's hearing with 2 types of test below at home.

- 1 Hearing Ability Test by rubbing fingers
- 2 Hearing Ability Test by "whispering"

These 2 tests are not so much difficult but essential to take "correctly".

Especially "whispering" is very important to let out in a correct way.

Please read "Information about Hearing Test at Home" written on back carefully and take the test and write down the test-results.

Please bring this paper on the day of Health Check-up for 3 years old child.

*This interview will not be used for any other purpose but to manage the child health.
